

With our roots in medical cannabis, Xtracted Labs was founded on the mantra

“safe for the patient, safe for the processor.”

We carry that ethos into every aspect of our business and pride ourselves on developing a range of products for all types of consumers.

Brand	Product	Cannabis Distillate	Cannabis Terpenes	Natural Terpenes	MCT Oil	Hardware
Refine	Premium Loud™ Cartridge	x	x			Genuine CCELL
	Premium Loud One Time	x	x			Genuine CCELL
	Premium Cartridge	x		x		Genuine CCELL
	Premium One Time	x		x		Genuine CCELL
	Classic Cartridge	x		x		Genuine CCELL
	Classic One Time	x		x	x	Classic Wick
NW Concentrates	Classic Cartridge	x		x	x	Classic Wick

Things we refuse to use in Refine and Northwest Concentrate vape products from Xtracted Labs:

PG - Propylene Glycol
 VG - Vegetable Glycerin
 PEG - Polyethylene Glycol
 Other unspecified thickeners or thinners
 Artificial terpenes

Due to the recent news reports on undiagnosed illnesses attributed to vape products and the tragedies attributed to contaminants found in illicit vape pens we understand some people are wary of vape cartridge formulations. If your customers are concerned about vaping Xtracted products or have an aversion to MCT oil but still wish to utilize vape cartridge technology and convenience we recommend our Refine Premium Loud Cartridges that do not include anything but Refine Activated Distillate and native, strain-specific cannabis terpenes extracted from locally grown cannabis.

What is Cannabis Distillate?

Cannabis distillate is one of the most pure and effective cannabinoid products available. Through the distillation process all plant matter, fats, waxes and lipids are stripped away during processing. The result is distilled cannabis oil that is thick, pure, and potent which creates a compelling and versatile product we call RAD! (Refine Activated Distillate).

What are Cannabis Terpenes?

Cannabis terpenes are native terpenes produced naturally in cannabis plants that are extracted by Xtracted Labs and separated from the plant's cannabinoid profile during the distillation process. These strain-specific terpene profiles are 100% cannabis-derived and capture the individual nuance of aroma, flavor, and effect that makes each cannabis strain unique.

What are Natural Terpenes?

Terpenes are naturally-occurring compounds responsible for the aroma and flavors of organic material. The most abundant source for terpenes are plants, like fruits and flowers (cannabis included of course!). The natural terpene blends we use in some of our vape products are a combination of terpenes isolated from natural sources. We use natural terpenes (never artificial!) in some products because they open up a new world of possible flavors for vape products that consumers love.

What is MCT Oil?

MCT stands for medium-chain triglycerides which are medium-length chains of fats that are easily metabolized and processed within the human body. MCT oil is a flavorless, naturally-derived oil that is often extracted and fractionated from coconut or palm kernels. MCT oil is a popular health food and supplement used in diets and other healthcare regimens.

Why do some vape products include MCT oil?

MCT oil is flavorless and mixes easily with cannabis distillate and terpenes to formulate an oil that will flow through vapor cartridges effectively while maintaining a rich vapor quality that many consumers prefer.

We pride ourselves on creating products for all types of consumers. Some people prefer their vape pen to be completely cannabis derived and while that is our personal preference as well the reality is that many consumers enjoy interesting flavor combinations, prefer vape cartridges that do not crystalize or clog easily, and cherish robust vapor quality that allows them to blow large clouds of vapor.

Is MCT oil safe to vape?

MCT oil is generally recognized as safe for consumption. However, the science behind vaping any substance is incomplete. More research regarding vaporizing is needed before any definitive claims can be made by anyone about MCT oil or other formulations. Inhaling, vaping, or smoking any substance poses a risk to your respiratory system and overall health. So it's currently impossible for anyone to claim that anything in cannabis vapor products, including cannabis, is proven safe to vaporize or inhale.

What do we know about vaporizing MCT oil?

We know MCT is a better option than PG, VG, Vitamin E oil, and other thinning and thickening agents because it is naturally-derived and is not considered to be carcinogenic when low heat is applied to it. We also know that MCT oil can be viewed as healthy when utilized appropriately.

Currently MCT oil offers the safest alternative to other additives used in cannabis vapor formulations. However, at Xtracted Labs we are committed to our original mantra “safe for the patient, safe for the processor.” Which means we are constantly learning, listening, and innovating by educating ourselves on the latest cannabis science and technology, incorporating feedback from our retailers and customers, all while optimizing our products for safety and effectiveness as deeper research draws new conclusions.
