Basic Orchid Care

Orchids need six things to bloom. If you cannot identify your orchid, then start with these basic care guidelines:

Light - Give orchids bright light, but no direct sun.

Water - Water them thoroughly once or twice a week -- more when it's warmer, less when it's cooler. Make sure the water drains completely out of the holes at the bottom of the pot. Never leave the plant sitting in water!

Fertilizer - Fertilize them once a week when they are growing or blooming.

Air movement - Provide gentle air circulation for the plant.

Humidity - Provide some humidity for the plant; most do not like very dry environments. An easy way to do this is have a tray of rocks with water under your plant to provide humidity from beneath, but once again, do not let your plant sit in water!

Proper temperatures - Keep the daytime temperature between 65° - 75°F / 18° - 24°C with a nighttime temperature drop of a few degrees.
